

# FREQUENTLY ASKED QUESTIONS

## How should BoltLube be applied to an AR bolt?

## How can I get the most out of BoltLube?

BoltLube contains zMAX Micro-lubricant and is not like any lube that you have ever used. zMAX absorbs into the surface of the metal to provide lubrication and resistance to buildup. Metal pores open up when heated to around 180oF. This allows zMAX to soak into the pores, protecting the metal from the inside out. BoltLube relies on the thermal cycling of the parts for the greatest benefits. The best results are seen after using the firearm for a while.

## How often should I use BoltLube?

It's up to you. Ask 10 people how often they clean their guns and you will get 10 different answers. We clean guns every time after a shooting session. Most often, on tactical rifles, we want to leave them fouled and ready for work, so we clean, lube and shoot a couple of fouling rounds before putting them up. This insures first to second shot consistency and provides a more predictable cold bore shot.

## What should I use to clean my gun parts and the bore of my barrel?

We recommend a thinner liquid to penetrate and dissolve buildup deposits. Also, the rings on an AR require a thin liquid to get the particulates out. For this, use Bore Cleaner and Conditioner. Made specifically for bores, it is also for general cleaning.

It is critically important to clean and lube your bore. Using too much of any lube in your bore can cause unsafe buildup of pressure as the bullet travels down the barrel. We recommend you always run a dry patch through your bore before storing the rifle. Bore Cleaner and Conditioner is perfect for removing lead, copper, powder deposits, then protecting the bore from additional deposits and rust.

## Is BoltLube better than the lube I currently use?

Yes, and here's why: First, BoltLube does not evaporate or dry out to sticky sludge like other products. It stays liquid to lube and suspend particles of carbon and residue. This keeps your firearm parts clean and easy to service.

Second, zMAX Micro-lubricant penetrates the metal to prevent carbon and deposit buildup. Put it on the AR bolt tail and see the difference. Most cleanups can be done with a paper towel once BoltLube has seasoned into your gun parts.

Third, BoltLube is temperature stable, meaning it is still thick enough to provide protection in the heat of summer and pourable enough to flow in the dead of winter.

## What about revolvers?

Bore Cleaner and Conditioner is the perfect lubrication for rotational parts. The open nature of the cylinder to bore gap makes the face of the cylinder ideal for Bore Cleaner and Conditioner to prevent deposits.
